Nitric oxide (NO) and nitrogen dioxide (NO<sub>2</sub>) are removed from air by an adsorbent including a combination of a support and an alkali material. The support is a mixture including manganese dioxide (MnO<sub>2</sub>) and copper oxide (CuO). The alkali material may be, for example, potassium carbonate (K<sub>2</sub>CO<sub>3</sub>) or potassium hydroxide (KOH). The adsorbent allows efficient NOx removal occurs at temperatures below 100°C.
